

Course:

Creating Web Pages with HTML5 and CSS3

Module 4. Animation in CSS3

Task 1

Implement an HTML page with the clock.

When opening the page, clock hands must move infinitely. The minute hand must move faster than the hour hand.

Example of the final result:

Task 2

Implement an HTML page with wings.

Initially, two identical blocks that hide text are displayed on the page. When any of the blocks is hovered, they open slowly (in 2 seconds)

and reveal the text. If you move the pointer away, everything abruptly returns to the initial state.

Example of the initial state:

Example of the hovered block after the animation is over:

Task 3

Implement an HTML page with several blocks of text + image.

Requirements:

- the block consists of text and an image that equally divide the available width;

- the block height must be fixed;
- the text must be in the center;
- the image must occupy its whole block in width and height;
- the image must not go beyond its block;
- when hovered over (text + image):
 - a translucent black block must fully cover them in 0.3 seconds;
 - the image must slowly (within 1 second) enlarge but not go beyond its block.

Select images on your own.

Example of the result (the third block is hovered):
